HYDRAULIC HOSE, FITTINGS & TUBING

Hydraulic hoses are critical in allowing hydraulic fluid to move between different hydraulic system parts. Hydraulic hose fittings connect hydraulic hoses, tubes and pipes with pumps, valves, cylinders, and other components. Hydraulic tubes enable the passage of fluids within and among system components.

Hydraulic Hose & Inserts

Hydraulic hoses are typically constructed from flexible rubber or wire and have multiple layers for strength and durability. These layers include an inner tube, a reinforced layer, and an outer layer.

A hydraulic hose enables fluid to flow from one section to another, ensuring unrestricted movement through a structure. There are two types of hydraulic hoses: SAE standards (from the Society of Automotive Engineers) and EN standards (European).

Hydraulic hoses are utilised in various industries, including automotive and rail, pharmaceuticals, construction, manufacturing, and agriculture.

VOSS Hydraulic Compression Fittings

24° coupling range with a wide variety of system solutions

VOSS 24° DIN tube couplings are a hydraulic tube coupling system that is widely used worldwide and specified to ISO 8434-1 and DIN 2353.

The product range includes the light (L) and heavy (S) series, which differ in pressure ratings and dimensions. All the nominal pressure ratings (PN) mentioned below are designed with a 4:1 safety factor.

VOSS fluid compression couplings are available in various configurations.

The main advantages of 24° couplings

- This type of coupling is leak-tight & can resist alternating bending moments pressure transients & prevent tubes from tearing out of the connection
- Assembling these tube connections is a quick & straight forward process
- The connection can be removed & reassembled as often as desired, which is particularly important for servicing & maintenance
- These tube couplings are easy to install, compact, & offer maximum leak-tightness even at high pressures of up to 800 bar
- A wide range of designs allows for a modular approach when choosing components, avoiding the need for special couplings & unnecessary tube loops
- Male threaded variants come with various metric & imperial threads and seal types
- Subsequent re-tightening is unnecessary when using 24° coupling systems, as the coupling cannot come apart independently under normal conditions
- The 24° coupling system allows for flexible connections that absorb piping system vibration, unlike rigid permanent connections that can often tear apart
- Various thread and seal types conforming to international standards can be provided for screw connections
- All VOSS couplings come standard with a VOSS coat finish, providing optimal corrosion protection
- Many independent certification bodies have confirmed the functional characteristics of the entire coupling system

Twin Ferrule Stainless Steel Fittings, Tubing & Clamps

Twin ferrule stainless steel compression tube fittings are widely used in industrial applications due to their ability to handle higher pressures, harsh conditions, and low-pressure operations.

They provide a reliable seal to prevent leakage in the system, and their leak-tight seal, excellent chemical resistance, ability to withstand various temperatures, and suitability for use in harsh environments make them a safe choice.

Choosing the most appropriate twin ferrule stainless steel fitting is crucial to ensure optimal performance.

VALVE BREATHER CAPS

FEATURES

Valve opens when pressure exceeds 0.010 bar or 0.100 bar.

SFV valve breather caps are particularly suitable for those applications (speed reducers, variators or compressors) when the internal air pressure must not exceed a certain value (10 or 100 mb).

The safety valve of the cap allows the expulsion of the exceeding air in the reservoir, thus re-establishing the pressure values for which the valve is set.

A sealing disc prevents both dust from getting in & oil-losses.

Quality

ROTOFLUX guarantees the continuous high quality of its unions. Each union undergoes testing before despatch to ensure its quality. The Company uses high-quality materials such as stainless steel, steel, aluminium, and brass to manufacture all its unions. Strict control measures are implemented throughout the manufacturing process to ensure that all ROTOFLUX unions meet the critical technical specifications required by the customer. All sub-components undergo stringent control checks to maintain the quality needed.

Rotoflux Balanced Sealing

Carbide-to-carbon graphite seals are used for clean water, air, vacuum, and hot oil applications, while carbide-to-carbide seals are used for poorly filtered water, hydraulic oil, coolant, and abrasive fluids. The seal faces are micro-lapped to ensure a perfect mating.

UNIONS FOR HIGH SPEED, MQL, COOLANT, AIR & DRY RUN APPLICATIONS

DESCRIPTION

These unions are designed for machine tool spindles rotating at high speed with fluid (coolant, air or MQL) passing through or dry when needed. The seals, balanced & microlapped, remain always closed without problems both with fluid passing through (wet run) or without fluid (dry run). Do not use the unions at max application limits without consulting ROTOFLUX.

INSTALLATION

Although ROTOFLUX unions are sturdy, they require careful handling. We recommend the following steps for proper installation:

- To ensure optimal performance of the fluid circuit, it is essential to clean it thoroughly when new and remove any machining burrs or abrasive particles that may be present. For existing fluid circuits, it is vital to ensure that the filters meet the typical hydraulic circuit requirements in terms of quality and functionality.
- Clamp the rear of the union in a bench vice & fasten the flexible hose (sketch 1).
- Do not use solid pipes.
- Install the rotary union onto the shaft (sketch 2).
- Connect the flexible hose to the supply line, ensuring the union is not over-tightened (see sketch 3).
- When using metallic flexible hoses in short spaces with sharp curves, it is recommended to use rigid 45° or 90° elbows to avoid undue stresses. Sketch 4 demonstrates the use of these elbows. Ensuring that the union does not rotate eccentrically, or wobble is essential.
- If the fluid transported is hot or dangerous, applying a union guard for added safety is advisable.
- It is essential to lubricate the union regularly.
- Periodically inspect the union to ensure it is adequately maintained and detect any signs of leakage.
